

Dallas – Fort Worth TexITE
Joint Meeting, 2018

Planning and Simulating Roundabouts in North Texas

Outline

Roundabout Planning

Roundabout Planning

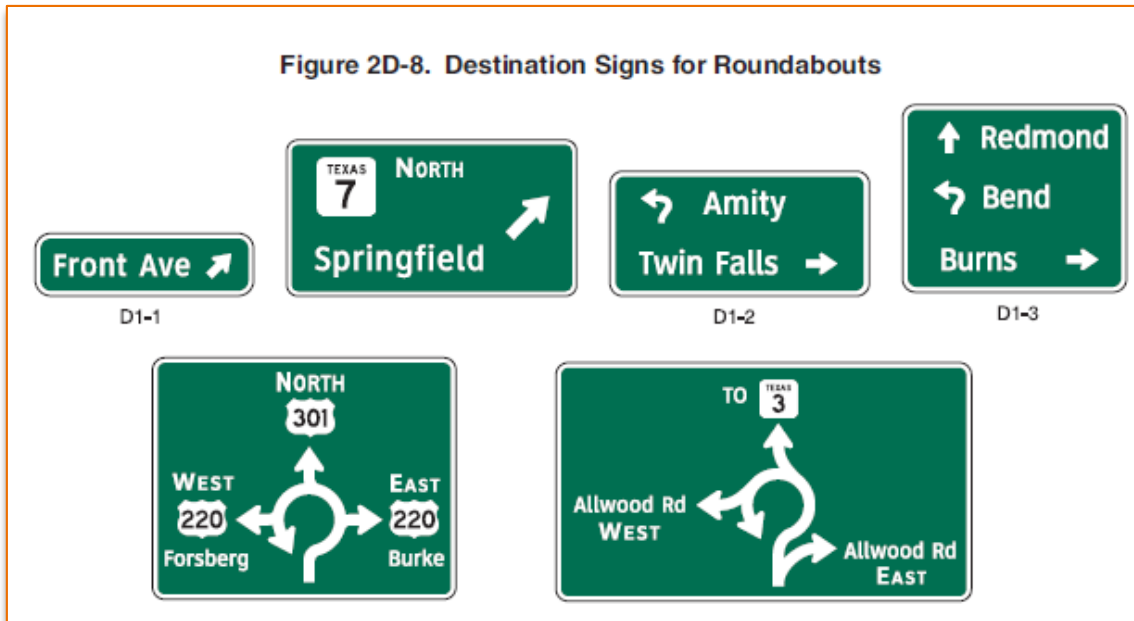

1. Simplifying & Explaining Pathing
2. Accounting for Large Vehicles
3. Showing how Roundabouts are Safer
4. Economic Benefits vs. Construction Costs

Explaining Roundabout Pathing

- Generally, lane changing within a roundabout should be avoided
- For complex layouts, important to illustrate vehicle movements

Signing

- Signing at roundabout entrances should direct driver to appropriate lane
- Signing within circular roadway tells driver when to exit

Safety

The screenshot shows the CMF Clearinghouse search results page. At the top left is the CMF logo (Crash Modification Factors Clearinghouse). To the right are navigation links: "Skip to main content", "Notice", "Sign Up for our e-Newsletter", and "Home". Below the logo is a blue navigation bar with links: "About the CMF Clearinghouse", "Using CMFs", "Developing CMFs", and "Additional Resources". The main content area has a dark header with "Home > Search Results". The title "Search Results" is in blue. Below it, text states: "There were 158 CMFs returned for your search on 'roundabout'. [modify your search]. Having trouble deciding between similar CMFs? Use our comparison tool or Check out our FAQs. Overwhelmed by too many results? See our Search Tips." A "Results Control" section offers "Collapse All" and "Expand All" options, with a note to "Click on the links below to expand individual categories." The main results list includes: "Category: Bicyclists (6)", "Category: Intersection geometry (145)", "Subcategory: Other (19)", "Subcategory: Intersection geometry reconfiguration (126)", "Countermeasure: Conversion of intersection into high-speed roundabout", "Countermeasure: Conversion of intersection into low-speed roundabout", "Countermeasure: Conversion of intersection into multi-lane roundabout", and "Countermeasure: Conversion of intersection into single-lane roundabout". On the left side, there are filter sections for "Star Quality Rating" (1-5 stars), "Country" (U.S. & Canada, International), "Crash Type", "Crash Severity", "Roadway Type", "Area Type", and "Intersection Type".

- Lots of research done on safety benefits of building roundabouts
- Studies done by NCHRP, FHWA, IHS, others...
- Crash Modification Factors Clearinghouse gathers data on safety

Running a Cost-Benefit Analysis

Option	Construction Cost	Yearly Maintenance Cost	Yearly Delay Cost
Existing (Status Quo)	\$0	\$5,500	\$767k
Roundabout	\$3.1 million	\$0	\$287k
Signalization Option #1	\$315k	\$5,500	\$516k
Signalization Option #2	\$195k	\$5,500	\$474k

- Typically, roundabouts are more expensive than traditional intersections, esp. if ROW is needed
- This cost is offset slightly by not having to maintain a signal

Running a Cost-Benefit Analysis

Roundabout Simulation

What are we trying to answer?

1. Will a roundabout operate better than a traffic signal or stop control?
2. When will the design “break down”?

Modeling Tools

(Sidra)

(Synchro)

PTV

VISSIM

Reliance on
the HCM

“True” Microscopic
Simulation

TransModeler
Traffic Simulation Software

HCM vs. Sidra Standard Capacity Models

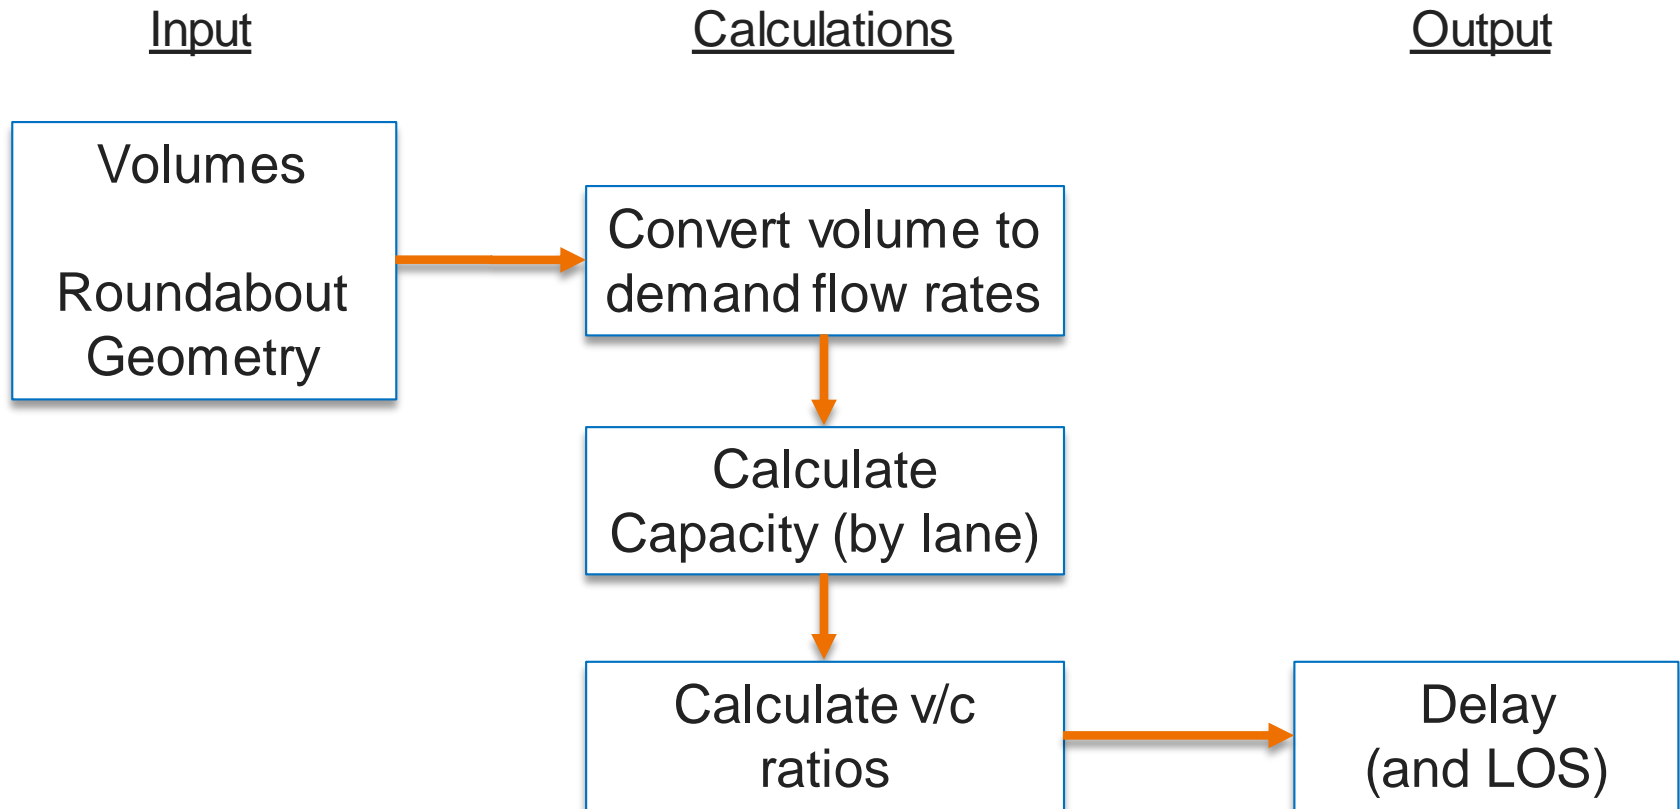

HCM 2010

- Based on observations at American roundabouts
- More well-known and accepted (in USA)

Sidra Standard

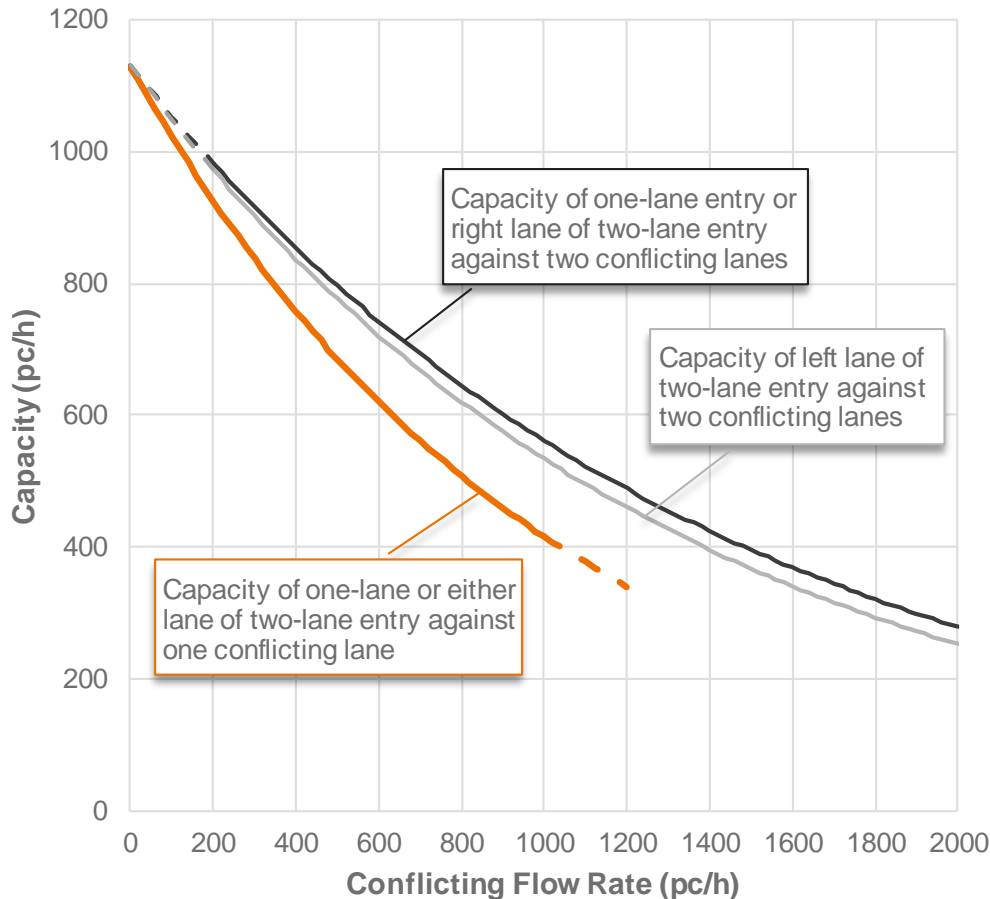

- Takes roundabout geometry into account
- Follow-up headway & critical gap affected by circulating flow rate
- Over-capacity approaches affect circulating flow rate (i.e. result in less delay for downstream approaches)

HCM 2010 Methodology (brief)

HCM 2010: Capacity

Exhibit 21-7 (Capacity of Single-Lane and Multilane Entries)

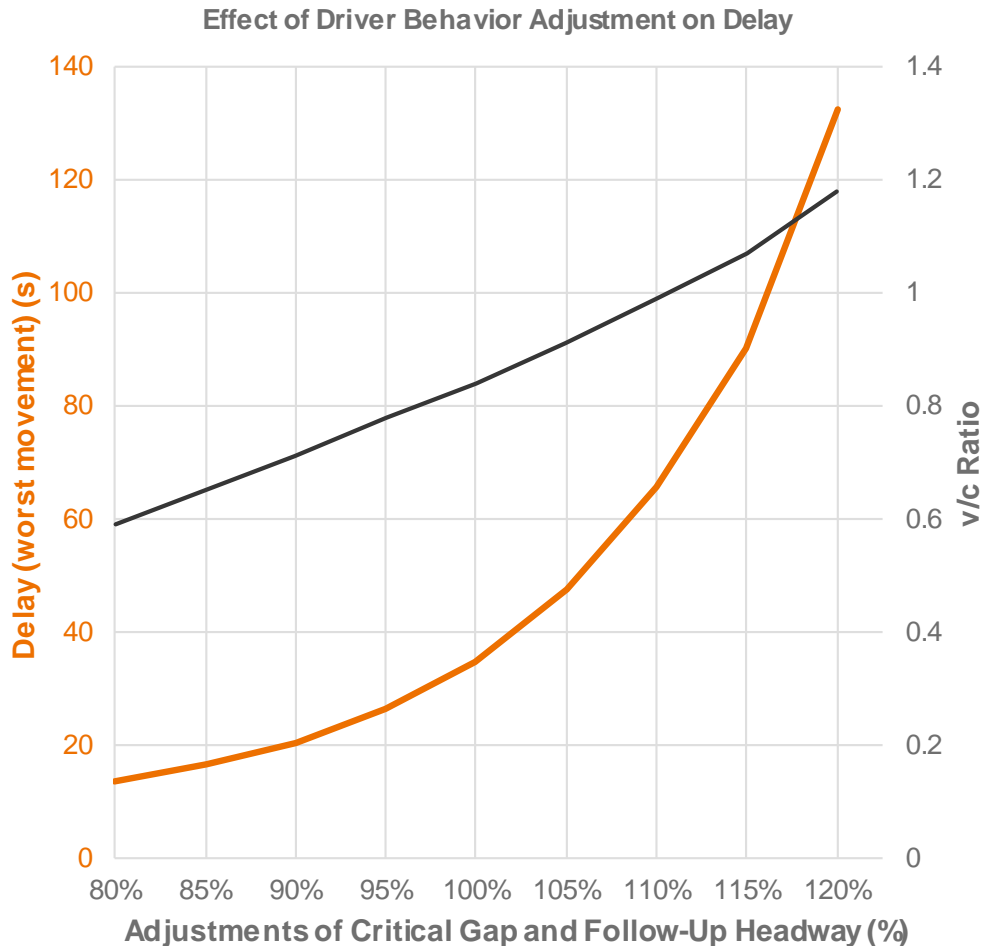

- Capacity is based on:
 - # of circulating lanes
 - conflicting flow rate
 - driver behavior
- Equations based on empirical observations (in USA)
- From HCM 2010:
 - *“U.S. drivers presently seem to display more hesitation ..., which results in lower observed capacities [than that in other countries].”*

Calibrating Roundabout Capacity

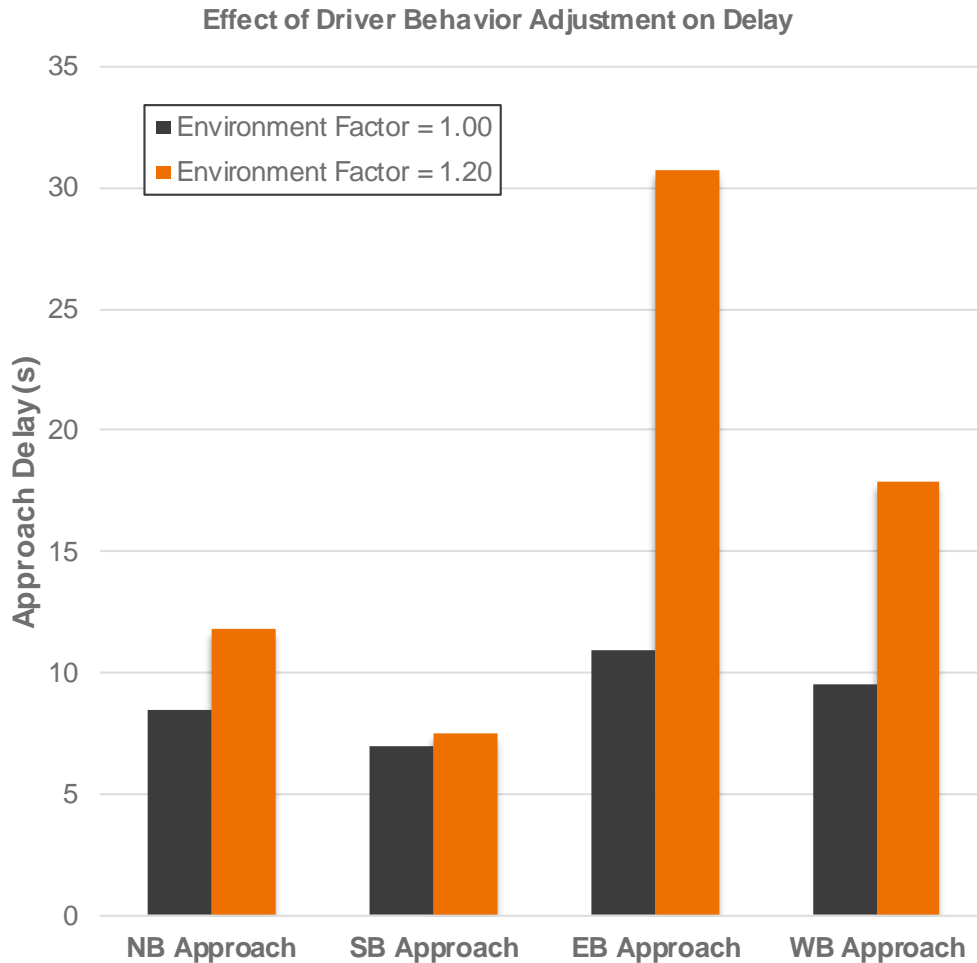

- HCM suggests calibrating driver behavior to local conditions
- Problem: budget rarely covers researching driver behavior
- Alternative: sensitivity analysis

Sensitivity Analysis (HCM)

- Sensitivity analysis done by adjusting the critical headway and follow-up headway
- 100% refers to the default parameters used by HCM

Sensitivity Analysis (Sidra)

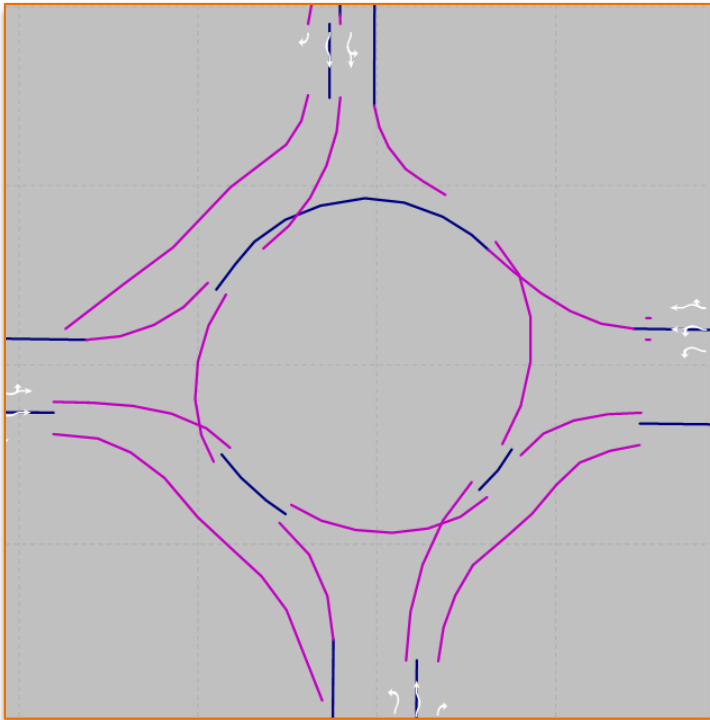

- Using the Sidra capacity model, adjust the “Environment Factor” parameter
- For the US, 1.20 is suggested
- For Europe/Australia, 1.00 is suggested

Why Vissim?

- Help visualize how the roundabout will work
- Client wants a video for public presentation
- Complex roundabout layouts
- Using signalization for roundabout metering (also in Sidra)

Vissim: Drawing Roundabout Links

- Strategy: avoid large conflict areas
- Generally avoid running connectors into links; instead, have two connectors join at beginning of link

Vissim: Priority Rules vs. Conflict Areas

- Generally, conflict areas are used in most cases. Priority rules are generally more of a “legacy” object
- Using priority rules can allow for better control of critical gap on a per-lane basis
- Takes longer than using conflict areas

Level of Service Considerations

- LOS for Unsignalized Intersections is normally applied to roundabouts
- HCM 2010: *“At the time of publication...no research was available on travel perception of quality of service at roundabouts”*.
- Sidra makes available its own LOS thresholds for roundabouts

	Standard	LOS
Delay = 53s	Signalized Intersection	D
	Roundabout (Sidra)	E
	Unsignalized Intersection	F

Thank you!
